(a) Assumed finding-rate histories, differing only before A
A = 426.7 Ma, oldest possible find
Relative finding rate, w
1.0
0.5
0.0
steady finding rate
earlier rate halved
earlier rate a tenth
limiting rise: finds doubling every 1.48 Myr
(b) Finds, the 95% limit T, and scenarios chosen after seeing the data
assumed delay d = 20 Myr: candidate ancestor t = 448.8 Ma
c = 393.47 Ma
(end of Emsian)
448.1 Ma
(a tenth: scenario)
431.0 Ma
(halved: scenario)
T = 428.8 Ma
(steady)
n = 48 finds certainly inside the window, stacked at their oldest possible ages
